

1 This listing of claims will replace all prior versions, and listings, of claims  
2 in the application:

3  
4 **Listing of Claims:**

5  
6 1. (currently amended) A software version control method comprising:  
7 assigning each of a plurality of data files to one of a plurality of specific  
8 corresponding downloadable file groups;  
9 for each downloadable file group, compressing together all assigned data  
10 files to form one processed image for the downloadable file group;  
11 deriving a unique identifier for the processed image using the processed  
12 image ~~associating each resulting processed image with a unique identifier derived~~  
13 ~~therefrom;~~  
14  
15 generating a listing of unique identifiers;  
16 storing the processed images and the listing of unique identifiers within a  
17 source device;  
18  
19 comparing the listing of unique identifiers with a current listing of unique  
20 identifiers of a client device; and  
21  
22 selectively sending processed images from the source device whose unique  
23 identifiers appear in the listing of unique identifiers but not in the current listing of  
24 unique identifiers in the client device.  
25

C1  
1 2. (previously presented) The method as recited in Claim 1,  
2 wherein the source device includes at least one server device.

3  
4 3. (canceled)

5  
6  
7 4. (previously presented) The method as recited in Claim 1,  
8 wherein assigning data files to downloadable file groups further includes assigning  
9 a plurality of related function data files to one downloadable file group.

10  
11 5. (previously presented) The method as recited in Claim 1, further  
12 comprising sending the processed image and the listing of unique identifiers to a  
13 client device that stores the processed image and the listing of unique identifiers in  
14 a persistent memory.

15 6-7. (canceled)

16  
17  
18 8. (currently amended) A computer-readable medium having computer-  
19 executable instructions for causing at least one processing unit to perform acts  
20 comprising:

21 assigning each of a plurality of data files to one of a plurality of specific  
22 corresponding downloadable file groups;

23 for each downloadable file group, compressing together all assigned data  
24 files to form one processed image for the downloadable file group;  
25

01  
1 deriving a unique identifier for the processed image using the processed  
2 image associating each resulting processed image with unique identifier derived  
3 therefrom;

4 generating a listing of unique identifiers;

5 storing the processed images and the listing of unique identifiers within a  
6 source device;

7 comparing the listing of unique identifiers with a current listing of unique  
8 identifiers of a client device; and

9  
10 selectively sending processed images from the source device whose unique  
11 identifiers appear in the listing of unique identifiers but not in the current listing of  
12 unique identifiers in the client device.

13  
14 9. (previously presented) The computer-readable medium as  
15 recited in Claim 8, wherein the source device includes at least one server device.

16  
17  
18 10. (canceled)

19  
20 11. (previously presented) The computer-readable medium as  
21 recited in Claim 8, wherein assigning data files to downloadable file groups  
22 further includes assigning a plurality of related function data files to one  
23 downloadable file group.  
24  
25

12. (previously presented) The computer-readable medium as recited in Claim 8, further comprising sending the processed image and the listing of unique identifiers to a client device that stores the processed image and the listing of unique identifiers in a persistent memory.

13-14. (canceled)

15. (currently amended) An apparatus comprising:

memory; and

logic coupled to the memory and operatively configured to assign each of a plurality of data files to one of a plurality of specific corresponding downloadable file groups, for each downloadable file group compress together all assigned data files to form one processed image for the downloadable file group, derive a unique identifier for the processed image using the processed image ~~associate each resulting processed image with a unique identifier derived therefrom~~, store the processed images and a listing of unique identifiers to the memory, and compare the listing of unique identifiers with a current listing of unique identifiers of a client device to identify processed images that need to be provided to the client device.

16-20. (canceled)

21. (currently amended) A system comprising:

a network;

a server device operatively coupled to the network and configured to assign each of a plurality of server-based data files to one of a plurality of specific corresponding server-based downloadable file groups, for each server-based downloadable file group compress together all assigned data files to form one processed image for the server-based downloadable file group, derive a unique identifier for the processed image using the processed image ~~associate each resulting processed image with a unique identifier derived therefrom,~~ and selectively output the processed images and a latest listing of unique identifiers over the network; and

a client device operatively coupled to the network and configured to communicate with the server device through the network, wherein the client device is further configured to maintain a listing of unique identifiers associated with processed images stored locally within the client device, compare the listing of unique identifiers with a downloaded latest listing of unique identifiers from the server device, and selectively download processed images whose unique identifiers appears in the latest listing of unique identifiers from the server device but not in the listing of unique identifiers in the client device.

22. (canceled)

23. (previously presented) The system as recited in Claim 21,  
wherein the server device is further configured to selectively assign a plurality of  
related function data files to one downloadable file group.

24. (canceled).

25. (previously presented) The method as recited in Claim 1,  
wherein the one processed image for the downloadable file group has a ".cim"  
extension.

26. (previously presented) The computer-readable medium as  
recited in Claim 8, wherein the one processed image for the downloadable file  
group has a ".cim" extension.

27. (previously presented) The apparatus as recited in Claim 15,  
wherein the one processed image for the downloadable file group has a ".cim"  
extension.

28. (previously presented) The system as recited in Claim 21,  
wherein the one processed image for the server-based downloadable file group has  
a ".cim" extension.

CI 1 29. (currently amended) A computer-readable medium having  
2 computer-executable instructions for causing at least one processing unit to  
3 perform acts comprising:

4 assigning each of a plurality of data files to one of a plurality of specific  
5 corresponding downloadable file groups;

6 for each downloadable file group, compressing together all assigned data  
7 files to form one processed image for the downloadable file group;

8 deriving a unique identifier for the processed image using the processed  
9 image ~~associating each resulting processed image with a unique identifier derived~~  
10 ~~therefrom;~~  
11

12 generating a listing of unique identifiers; and

13 storing the processed images and the listing of unique identifiers within a  
14 source device.  
15

16  
17 30. (previously presented) A computer-readable medium as recited in  
18 Claim 29, wherein the source device includes at least one server device.

19  
20 31. (canceled)  
21

22  
23 32. (previously presented) A computer-readable medium as recited in  
24 Claim 29, wherein assigning data files to downloadable file groups further  
25

C 1 includes assigning a plurality of related function data files to one downloadable  
2 file group.  
3

4 33. (previously presented) A computer-readable medium as recited  
5 in Claim 29, further comprising sending the processed image and the listing of  
6 unique identifiers to a client device.
